Socio-economic governance: achieving the Porto targets by 2030

Interactions between the social and employment objectives of the European Union

István György Tóth, András Gábos, Bea Cantillon and Brian Nolan

Purpose of the paper

- ❑ To highlight the role of the employment and social targets as an important part of the EPSR, reflecting the social face of EU governance
- ❑ To explore the interaction between employment and anti-poverty and social exclusion policies
- ❑ To make recommendations on the methods to monitor the targets and the related policies

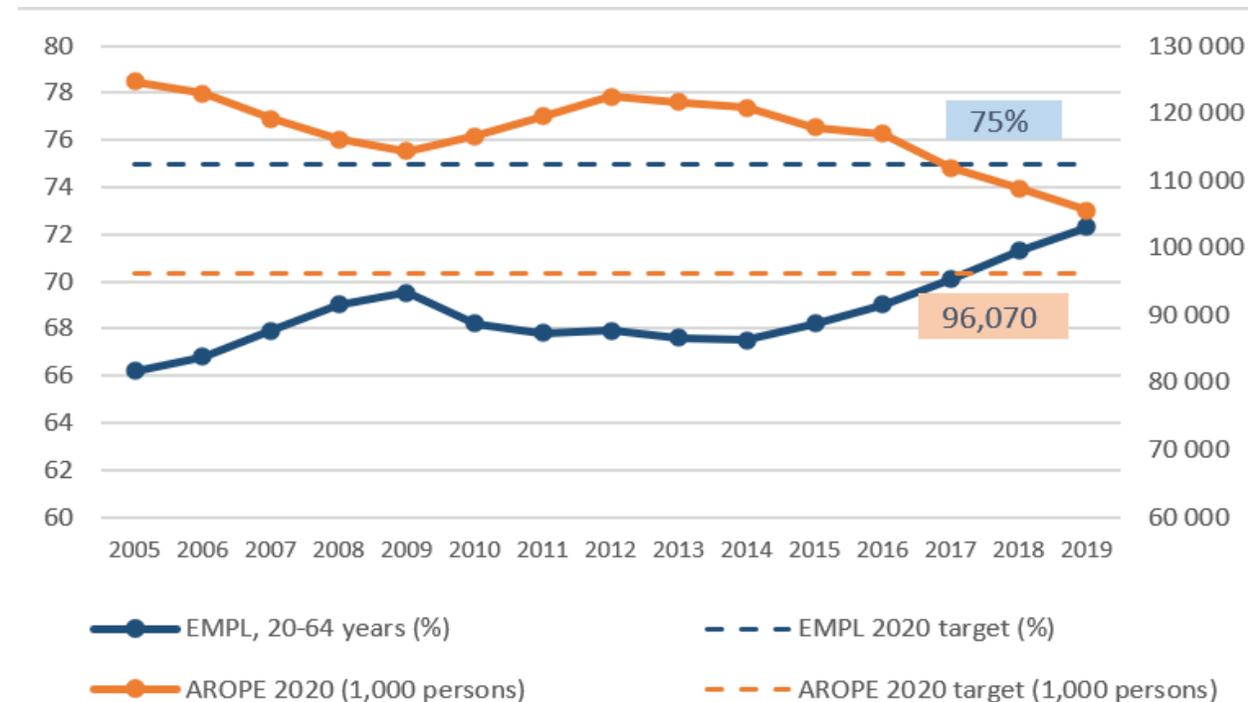

The paper focuses on understanding the relationship between employment and poverty, within the actual context: record high employment and record low unemployment, but still labour shortages and persisting poverty levels.

Employment and social target indicators in the EU

Indicator		Definitions
Employment target		Employment rate: 75% by 2020 78% by 2030
Social target		People at risk of poverty or social exclusion rate (AROPE): AROPE 2020: -20M between 2010 and 2020 AROPE 2030: -15M between 2020 and 2030 (of which at least 5M children)
	Relative income poverty	At-risk-of-poverty rate (AROP), AROP threshold: 60% of the national median hh equivalised income
	Deprivation	In the “old” 2020 AROPE target: severe material deprivation rate (SMD): enforced lack of 4+ out of 9 hh level items In the “new” 2030 AROPE target: severe material and social deprivation rate (SMSD): unforced lack of 7+ out of 13 individual and hh level items
	Household joblessness	Share of individuals living in (quasi-)jobless households (WI<0.2): AROPE 2020: population aged 0-59 AROPE 2030: population aged 0-64 (and some minor changes in the definition)

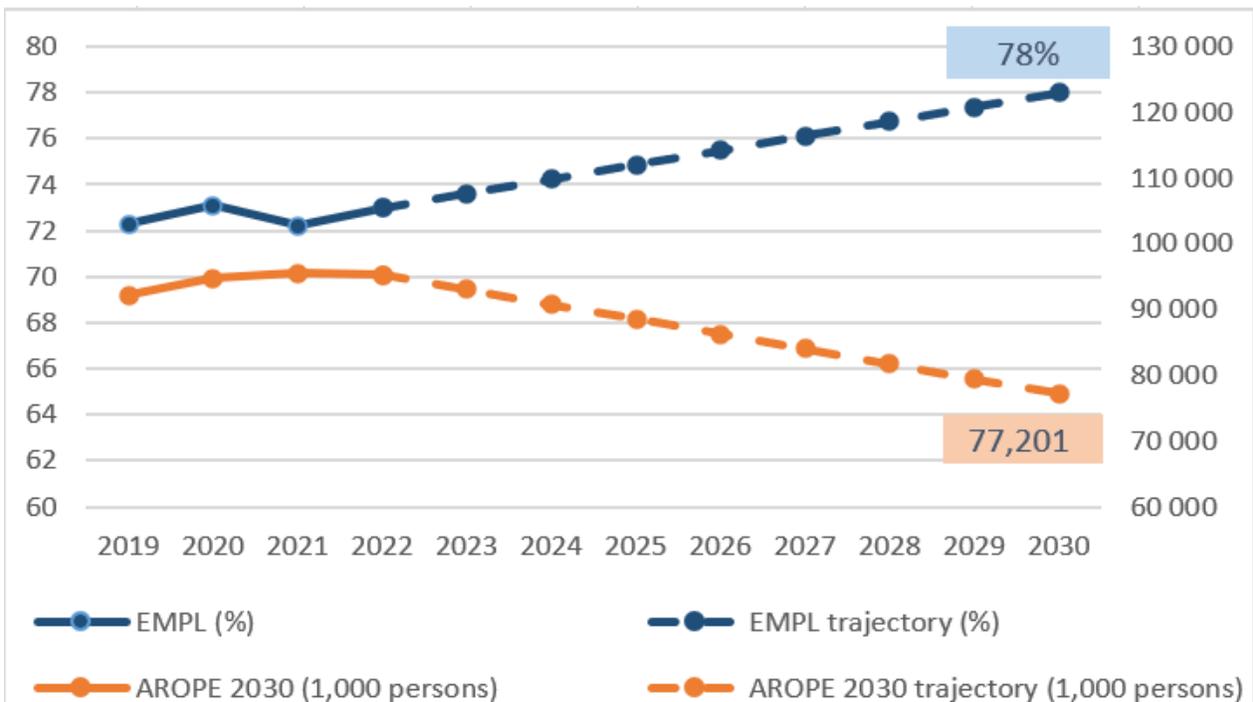

Employment (left axis, %) and AROPE (right axis, thousand persons) indicators are strongly and negatively correlated

Trends in the employment and **the social target (AROPE 2020) indicator** (total population, EU average, 2005-2019) and 2020 target values

- Strong overall increase in employment rate, but still short of the 2020 target
- Considerable improvement in AROPE: 117,4M (2008) → 109,6M (2020), but far from the target

Trends and required trajectories of the employment and **the social target (AROPE 2030) indicator** (total population, EU average, 2019-2030) and 2030 target values

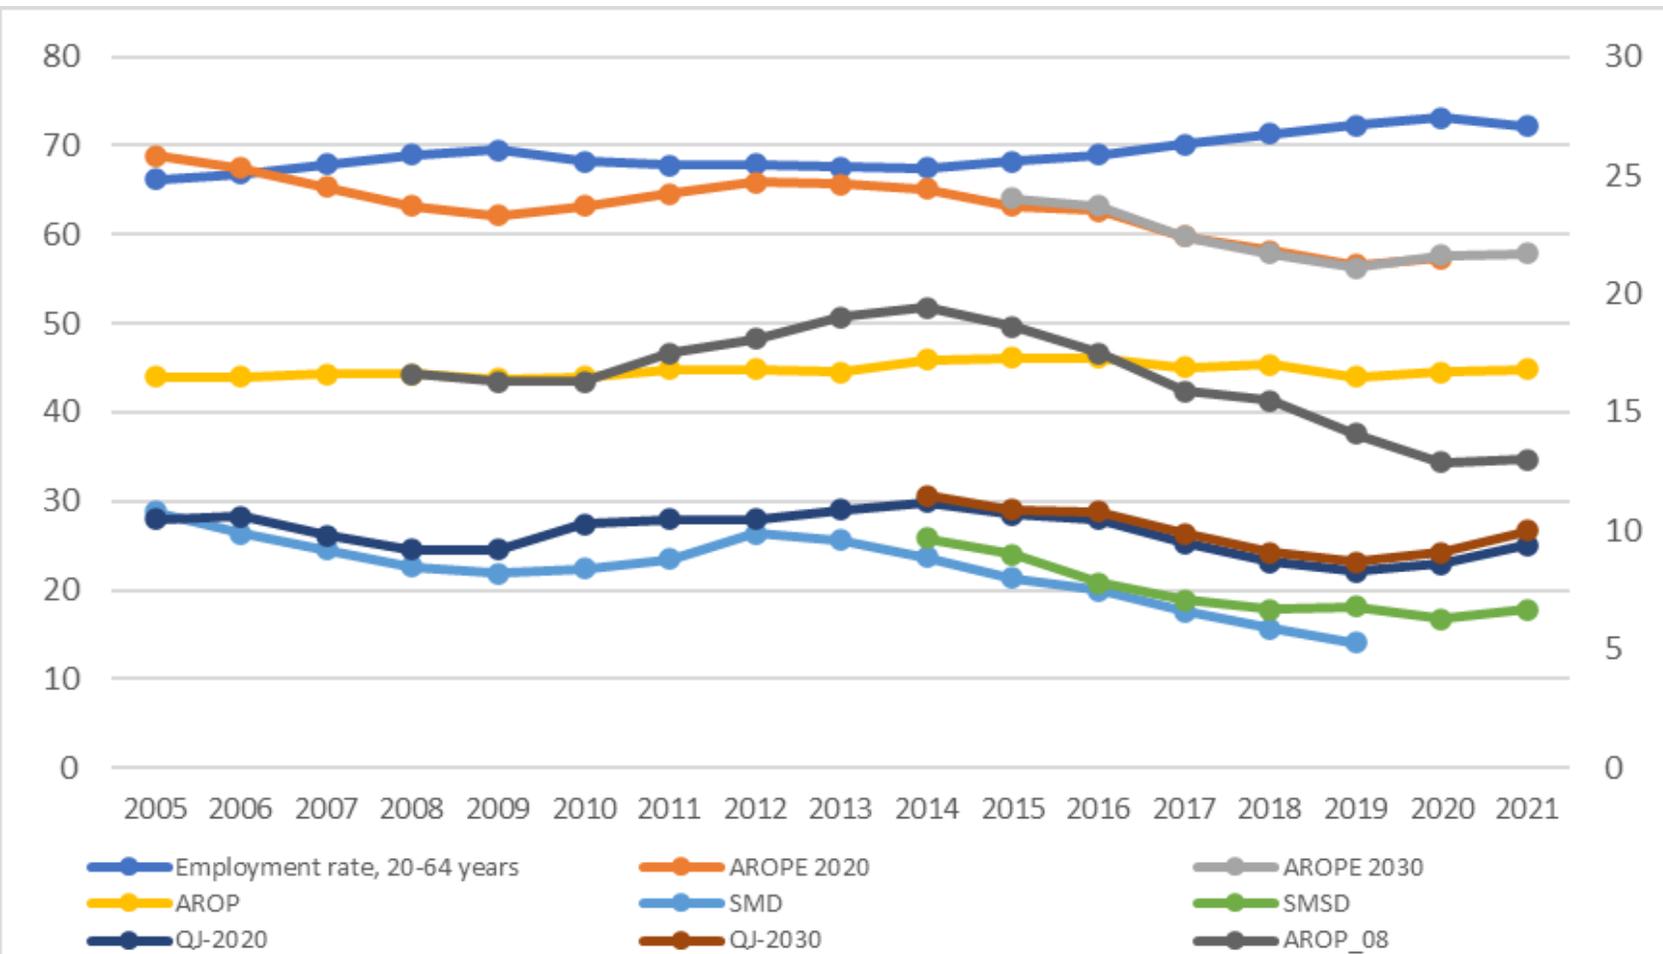

- Changes in the definition of two AROPE components and country coverage
- Concerted efforts are needed to simultaneously reach the Porto 2030 targets in both fields

Source: Eurostat database, retrieved on 31/7/2023.

Note. EMPL: year t-1, EU-27 from 2020. AROPE2020: EU-27, 2007-2019 (incl. UK, excl. Croatia), AROPE2030: EU-27, 2015+ (incl. Croatia, excl. UK).

The development of AROPE components at EU level

Trends in the employment (left axis), the social target (AROPE) indicator and its components, and anchored poverty rate (right axis), total population EU average, 2005-2021 (%)

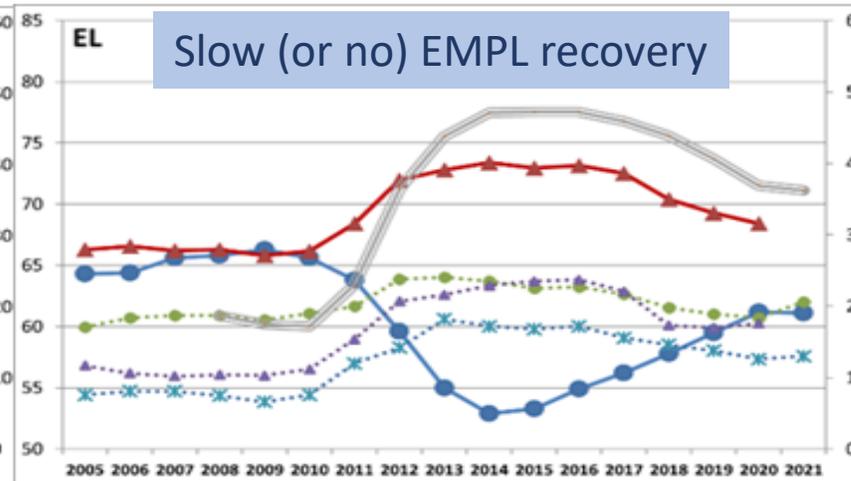

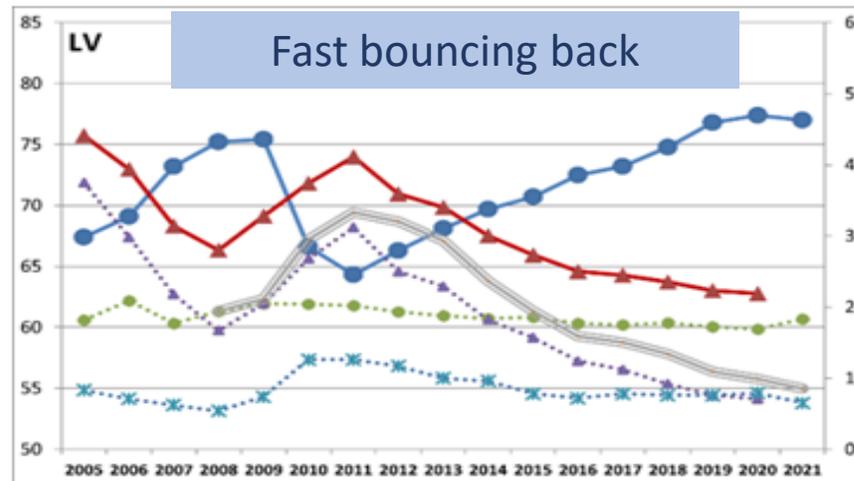

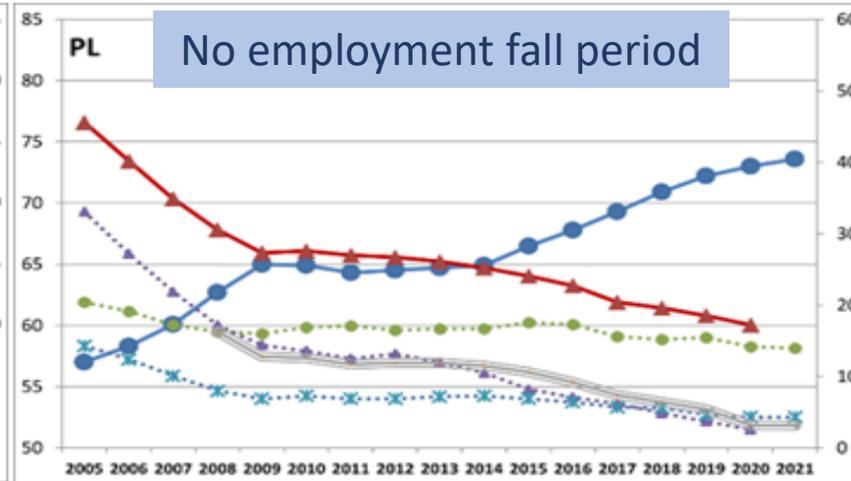

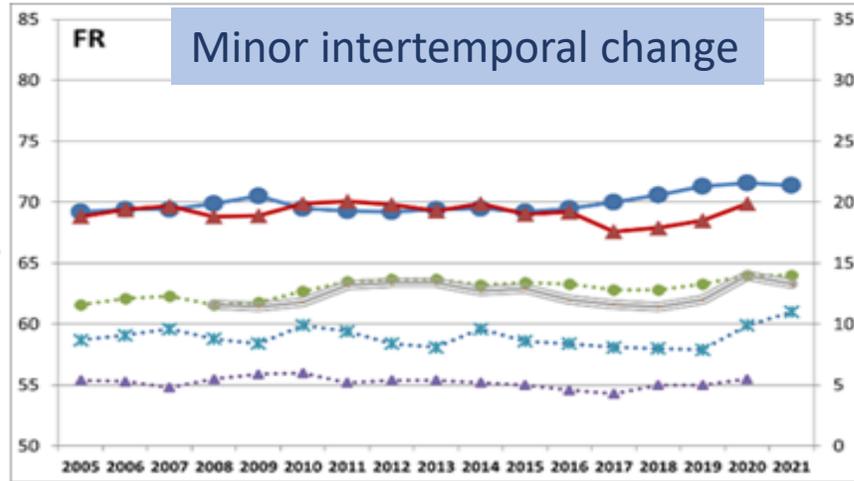

- New definitions for AROPE and components show similar trends
- There is no significant over time change in AROP
- However, anchored AROP has been more responsive during the analyzed period

Source: Eurostat database, retrieved on 31/7/2023.

Note. EMPL: year t-1, EU_27 from 2020. AROPE2020 and components: EU-27, 2007-2019 (incl. UK, excl. Croatia), AROPE2030 and components: EU-27, 2015+ (incl. Croatia, excl. UK).

The development of employment and AROPE at national level

The evolution of employment rate (left scale, for year t-1), AROPE-2020 and its components (AROP, SMD, QJ-2020), and anchored AROP in four idealtypical Member States, 2005-2021 (all data are for 18-64)

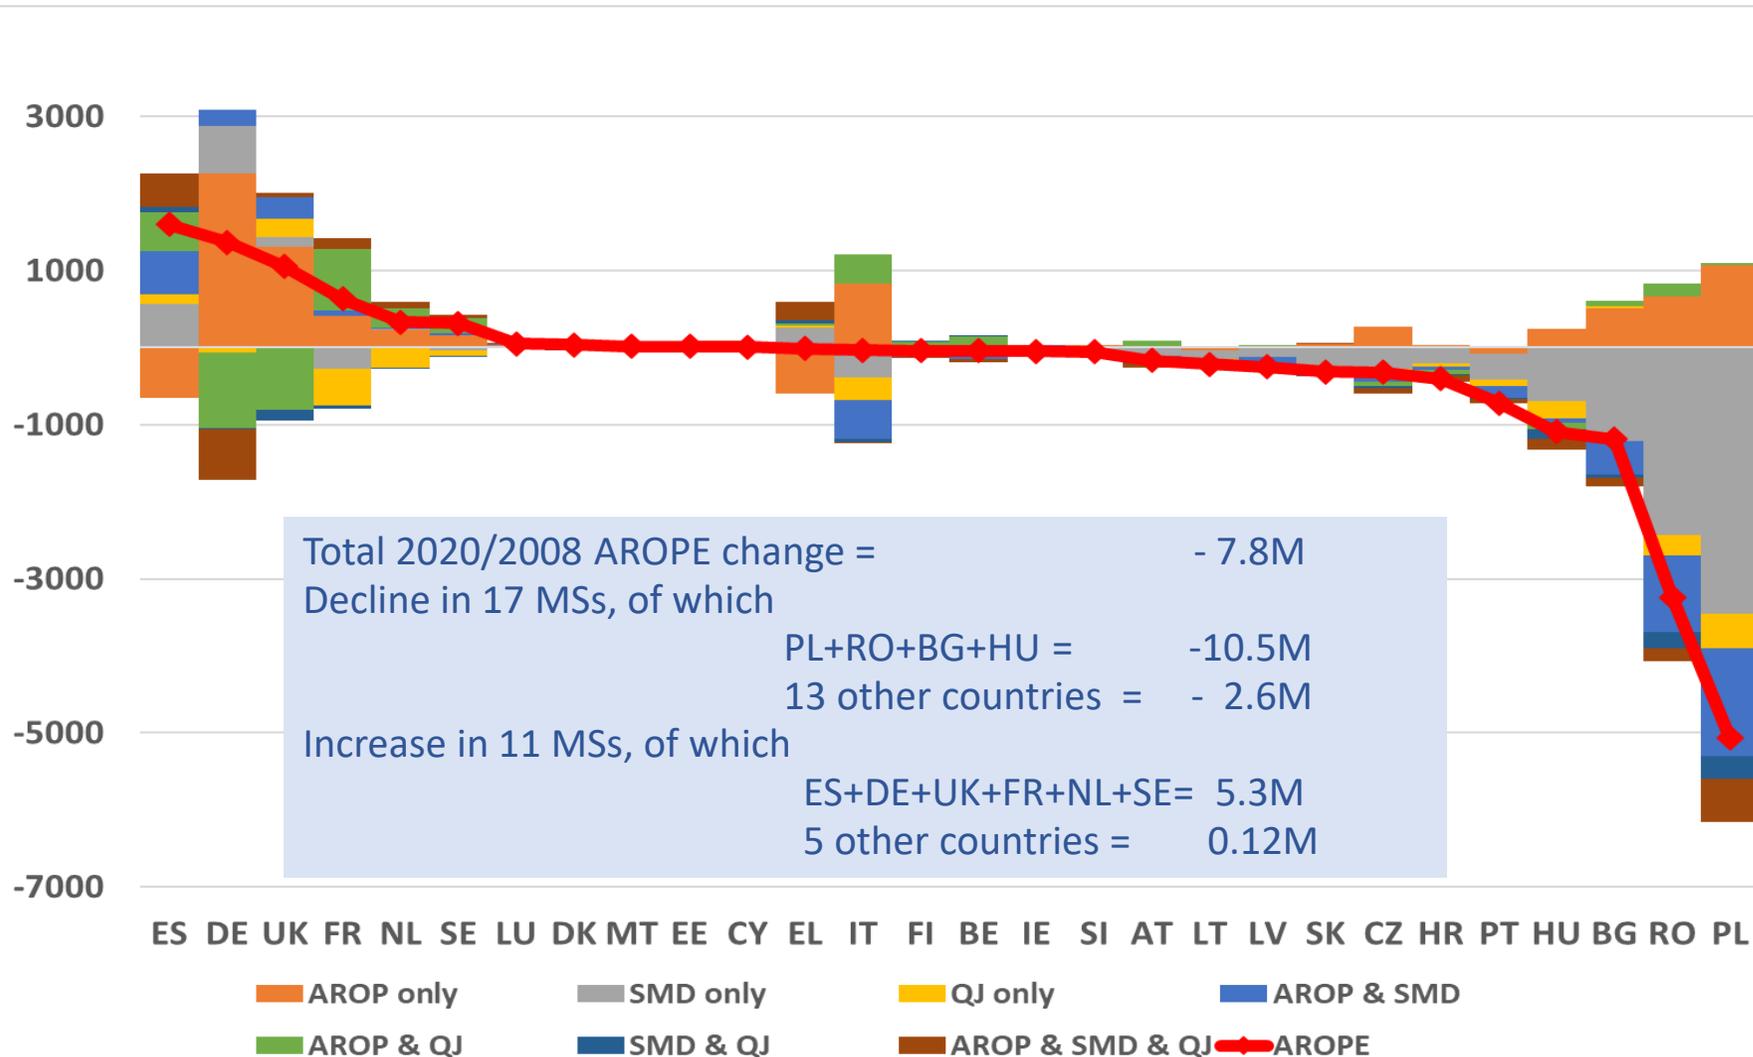

- In all types, AROPE shows a **clear negative correlation** (mirror image) with EMPL
- All Member States belong to one of these types
- It is only in **very few MSs** and **very short periods** when EMPL and AROPE **correlates positively**
- **Correlation between EMPL and anchored AROP is always stronger than EMPL with AROP**

●— Employment rate, 20-64 years
 ▲— AROPE 2020
 ●— AROP
 ●— SMD
 ●— QJ-2020
 — Anchored_AROP_08

Change in number of AROPE people concentrated in a few MSs and over time AROPE change is driven by components and country, selectively

Change in the number of persons at risk of poverty or social exclusion between 2008 and 2020, decomposed by source, EU Member States, (thousand persons)

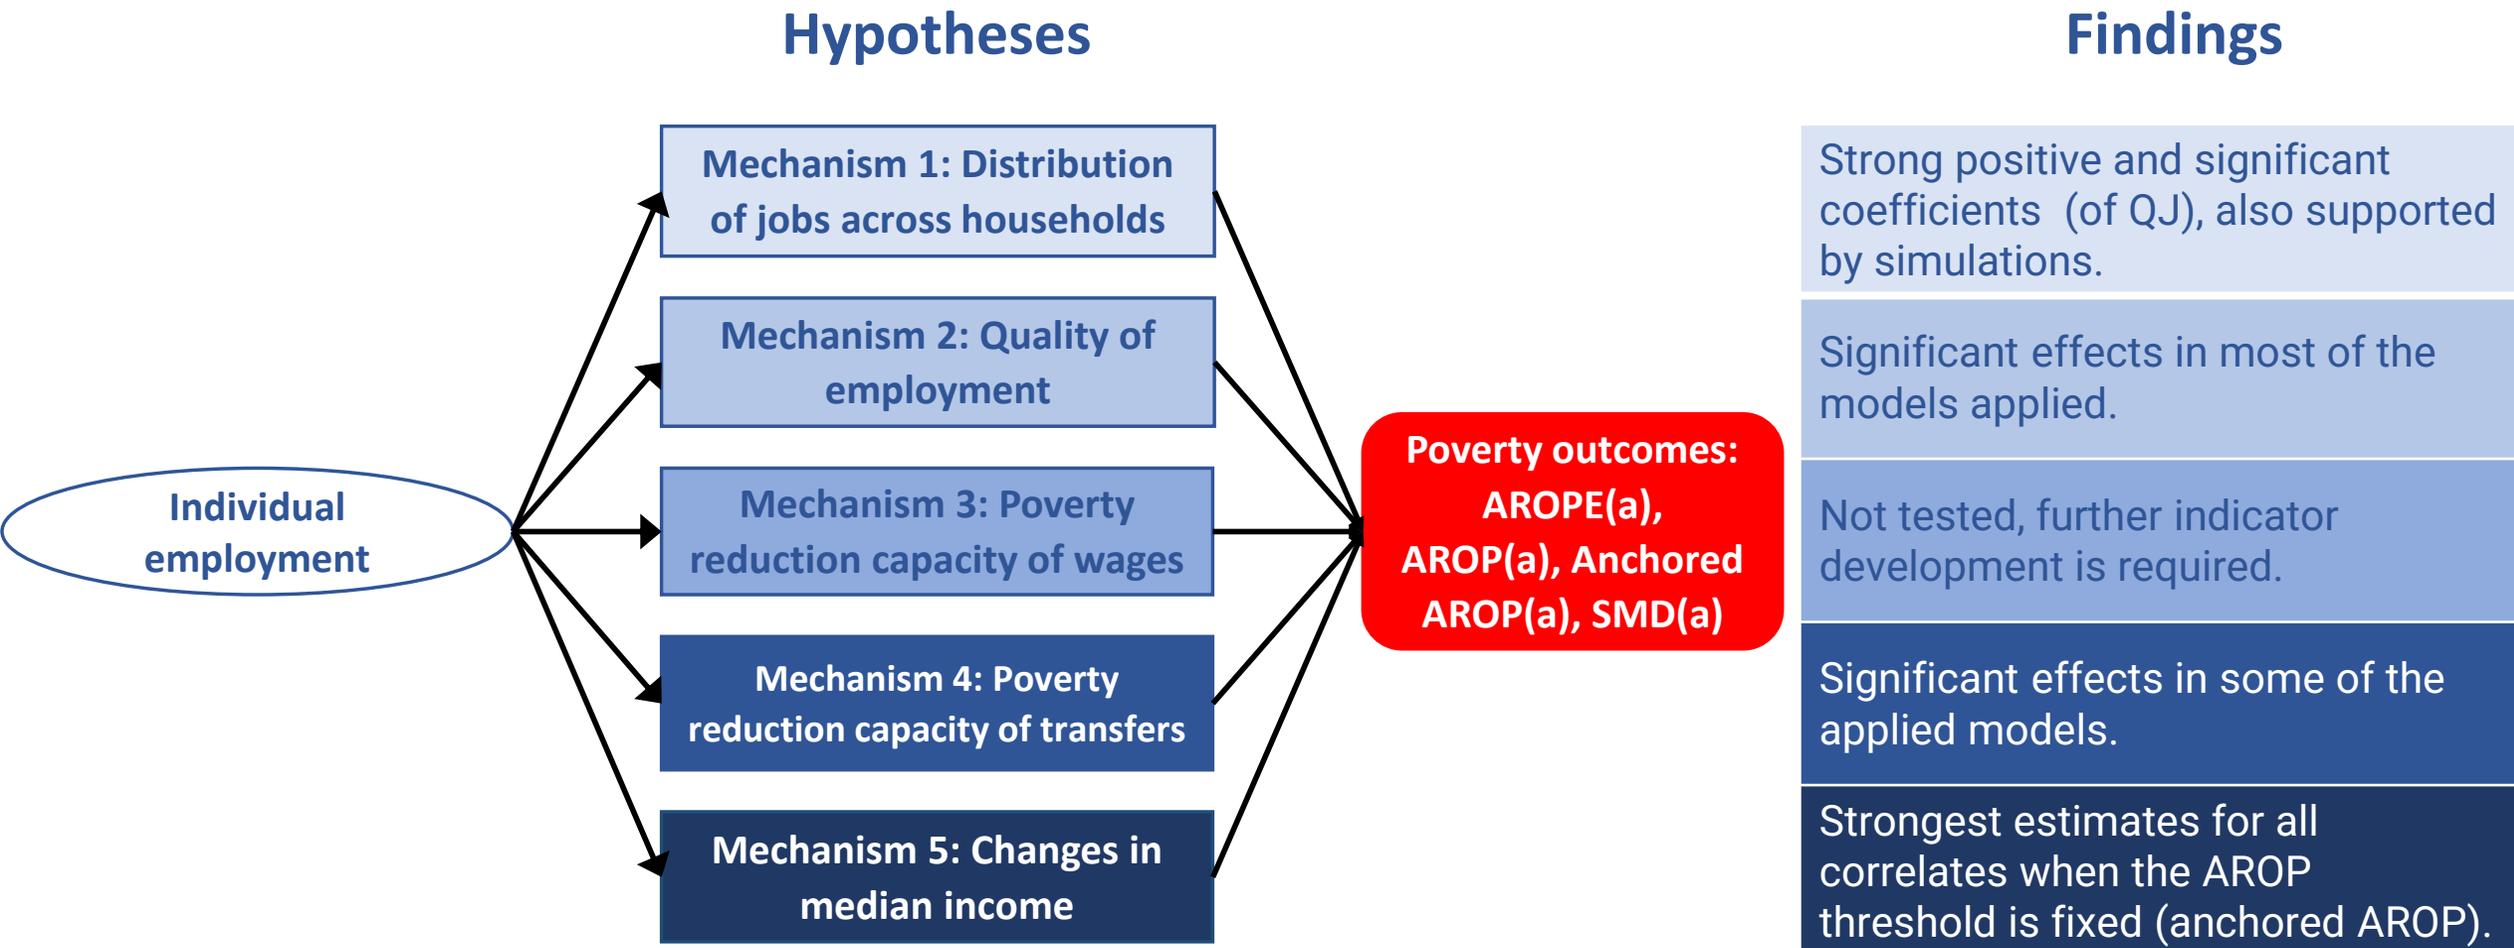

#1. driver: only SM(S)D
 - mostly in CEE, and in FR, IT & PT

only AROP:
 - positive (on the rise) in most countries (esp: DE & UK)
 - also positive in PL, RO, BG, HU & CZ, but drops in SMD rates offsets
 - decline only in few cases (ES & EL)

only QJ:
 - negative in several countries (e.g. FR, PL, IT, RO, NL, HU)
 - positive in the UK and ES

Core factors that mediate the impact of individual employment growth on (hh level) poverty and social exclusion

Method for testing the mechanisms: macro level multivariate regressions (time-series cross-sectional with country-level FE & first-difference design)

Units: country (27 EU MSs + UK) and year (2005-2021)

Lessons for policy

- ❑ Employment growth is very important for poverty alleviation, but other factors may further improve effectiveness.
- ❑ The distribution of new jobs across households is a key transmission mechanism between employment and poverty, therefore the focus should be on policies that are effective in reducing the share of persons living in QJ households.
- ❑ Quality of employment matters: better jobs improve both household income and well-being.
- ❑ Social protection contributes to direct poverty reduction, and also to resilience and human capital maintenance/development.

Lessons for analytic approach and indicators

- ❑ Member States' experiences in the field provide the opportunity for policy lab + mutual learning.
- ❑ The individual employment target should be closely monitored together with the share of persons living in (quasi-)jobless households.
- ❑ Aggregate income growth and employment growth (in itself) have a very moderate effect on relative income poverty. There is a need to further invest in a better understanding of the relatively weak correlation between AROP, employment and material deprivation.
- ❑ It is important to strengthen the monitoring of the targets, by making use of the full set of EU agreed social indicators (including the anchored AROP rate), as well as by enhancing statistical capacity for more timely indicators and for a better assessment of the impact of policies.
